I have created a fixture that returns a DbSet by using the following: var fixture = new Fixture().Customize(new AutoMoqCustomization()); fixture.Build().Returns(context.Items.GetItems().AsQueryable()); in this context.Items refers to a Unit of work that has a context variable called "Items" that has a DbSet called "Items". I am getting errors when running the unit test that states: Invalid key: IEnumerable`1. Any ideas on why this may be happening and how to resolve? Update When I log the value of context.Items.GetItems().AsQueryable() it has a count of 1, however when I pass the count as the second parameter, it says the count needs to be in the range of 0 to 40. var fixture = new Fixture().Customize(new AutoMoqCustomization()); fixture.Build().Returns(context.Items.GetItems().AsQueryable().Count); A: You are just projecting the original type without any customization, so there is no auto-generated polymorphism or any other feature that could possibly lead to the Invalid key: IEnumerable`1 error. Let's debug this. If you see the AutoMoqCustomization source, you'll notice that this is one of the few cases that use a Queryable implementation instead of IEnumerable: var 50b96ab0b6

Five cases of infection occurring after intramedullary nailing of the femur are presented in this paper. All the patients were male and the mean age was 52. The reasons for performing intramedullary nailing included: 1. patient's request; 2. medical conditions with potential risk of infection, such as congenital deformities; 3. fractures, for which intramedullary nailing is generally indicated. In three cases the infection occurred in the immediate postoperative period after nail insertion, and in two cases, 4 and 5 months after the operation, respectively. In all cases, the infectious process was disseminated along the intramedullary tract. The most common clinical presentation was fever and leukocytosis. In two cases osteolytic lesions appeared in the lateral projection of the femur, and in one case osteomyelitis was present in the femur head. Two cases had antecedents of acute respiratory syndrome with the SARS-CoV infection. In all cases, molecular biology and bacterial culture were consistent with diagnosis. It was obtained a slow, progressive response to antibiotic therapy in four cases. In one case of osteomyelitis the hip joint was fused with associated femoral head resection. The treatment did not include removal of the nailing.Human papilloma virus status and cancer stage among Ugandan women with cervical intraepithelial neoplasia and cervical cancer. Cervical cancer is a leading cause of cancer death in women, and has the potential to cause a significant morbidity and mortality in low-income countries. The prognosis of cervical cancer is highly dependent on the stage of the disease at presentation. Human papillomavirus (HPV) is a necessary cause of cervical cancer, but the prevalence of HPV types and their association with disease severity remain uncertain among African women. The purpose of this study was to examine the prevalence of HPV types and their associations with stage of disease among women diagnosed with cervical intraepithelial neoplasia (CIN) and cervical cancer in rural Uganda. A descriptive study was conducted among 106 women newly diagnosed with CIN and cervical cancer in Kitgum district, Uganda, in 2013. HPV testing was performed using the GenPoint HPV-
